### 14 1 The Human Genome

Chapter 14 The Human Genome The Human Genome Project (HGP) formally began in 1990 and was finished in 2003. The goal was to discover the DNA sequences for all of the 20,000-22,000 genes that are found in human beings. This knowledge is vital for research into genetic disorders and possible genetic solutions to these disorders.

Human genome, all of the approximately three billion base pairs of deoxyribonucleic acid ( DNA) that make up the entire set of chromosomes of the human organism. The human genome includes the coding regions of DNA, which encode all the genes (between 20,000 and 25,000) of the human organism, as well as the noncoding regions of DNA, which do not encode any genes.

#### Human genome | Britannica

The human genome is a complete set of nucleic acid sequences for humans, encoded as DNA within the 23 chromosome pairs in cell nuclei and in a small DNA molecule found within individual mitochondria. These are usually treated separately as the nuclear genome, and the mitochondrial genome.

#### Human genome - Wikipedia

The Human Genome Project (HGP) was one of the great feats of exploration in history. Rather than an outward exploration of the planet or the cosmos, the HGP was an inward voyage of discovery led by an international team of researchers looking to sequence and map all of the genes -- together known as the genome -- of members of our species, Homo sapiens.
