AASHTO Pavement Thickness Design Guide. AASHTO Pavement Thickness Design Guide. When designing pavement thickness for flexible and rigid pavements, the following considerations should be used. 1. Performance criteria (serviceability indexes). Condition of pavements are rated with a present serviceability index (PSI) ranging from 5 (perfect condition) to 0 (impossible to travel).

The Vermont Agency of Transportation procedure for the design of new or reconstructed pavement structures is based on the 1993 AASHTO Guide for Design of Pavement Structures, referred to simply as the '93 Guide in this procedure. Pavement structures designed using this procedure must have a minimum 20-year Design Lane ESAL estimate of 100,000.

Another reference is The AASHTO Guide for Design of Pavement Structures, 1986. These guides are based on mechanistic/empirical design models, and they use Nomographs to attain pavement thickness. Several computer programs for designing pavements (including Asphalt Institute and AASHTO programs) are also available.
