The Center for Computational Biology and Bioinformatics (CCBB) provides investigators with core bioinformatics expertise to analyze large molecular datasets, especially from next-generation sequencing.

Center for Computational Biology and Bioinformatics

While computational biology emphasizes the development of theoretical methods, computational simulations, and mathematical modeling, bioinformatics emphasizes informatics and statistics. Though the two fields are interrelated, bioinformatics and computational biology differ in the kinds of needs they address.

Bioinformatics vs. Computational Biology: A Comparison

Genome Informatics 2020 will focus on large-scale approaches to understanding the structure and biology of genomes. This conference will once again bring together computational biologists, human geneticists and others working on comparative and evolutionary genomics to discuss recent advances in this fast moving field.

Genome and Epigenome Informatics

This course will use a project-based approach to introduce undergraduates to research in computational biology and genomics. During the semester, students will take a series of large data sets, all derived from recent research, and learn all the computational steps required to convert raw data into a polished analysis.

Computational Biology Courses at Hopkins

Bioinformatics and computational biology involve the analysis of biological data, particularly DNA, RNA, and protein sequences. The field of bioinformatics experienced explosive growth starting in the mid-1990s, driven largely by the Human Genome Project and by rapid advances in DNA sequencing technology.
