These poles generally have rectangular holes throughout their length to facilitate the climbing of poles and reduce the weight of poles. Steel Towers for Transmission Lines In practice, the steel tubular poles and R.C.C poles are usually used for distribution purposes and steel rail poles as well as narrow-base lattice steel towers are used for 11 kV and 33 kV overhead lines.

1.27 "Pole" means a utility pole that is owned by NES that supports power lines or streetlights. Poles may be wood, steel, aluminum, or concrete. 1.28 "Pole Attachment" means each communications wire or line attached to a pole, including, but not limited to, cables and service drops. A span wire required to support an

larger diameter pole base plates such as used in the telecommunication industry (poles 36 to 72 inches in diameter). Therefore, such design techniques may or may not be appropriate. Recent finite element studies(5,6,7) have indicated that current design practices used by pole manufacturers may be under-designed by 20 to 30%.

Identifying the wires on electrical poles is easy when you start at the top and work down. Locate the static wire at the very top of the pole. This is designed to redirect lightning away from the lower power-conducting lines to avoid induced power buildup and possible damage. The static line connects to a grounding conductor.

The concrete electric pole is made of cement concrete. To increase the strength, we use iron bars or rods reinforcement in the concrete. For earthing purpose, we place a copper strip of size 25mm × 3mm inside the pole during concreting, or we keep a hollow channel in the pole for inserting the earthing wire.
