Advanced Search. Invasive hemodynamic monitoring has been present in the intensive care unit since the early use of central venous pressure catheters for monitoring fluid volume and mercury manometers for measuring pressures via arterial catheters. Technology, scientific advances, and translational research have brought many changes from those early years, including less invasive methods that require different knowledge and competencies.

Hemodynamic monitoring is the observation of hemodynamic parameters over time, such as blood pressure and heart rate. Blood pressure can be monitored either invasively through an inserted blood pressure transducer assembly (providing continuous monitoring), or noninvasively by repeatedly measuring the blood pressure with an inflatable blood pressure cuff .
