2. Bivariate data - This type of data involves two different variables. The analysis of this type of data deals with causes and relationships and the analysis is done to find out the relationship among the two variables. Example of bivariate data can be temperature and ice cream sales in summer season.

Bivariate and multivariate analyses are statistical methods to investigate relationships between data samples. Bivariate analysis looks at two paired data sets, studying whether a relationship exists between them. Multivariate analysis uses two or more variables and analyzes which, if any, are correlated with a specific outcome.

### **The Difference Between Bivariate & Multivariate Analyses ...**

We will discuss the three major goals of multivariate analysis and their associated techniques: (1) data reduction (principal components, factor analysis, and cluster analysis); (2) discrimination and classification (cluster analysis, discriminant analysis); and (3) hypothesis testing (multivariate regression, multivariate analysis of variance, logistic regression).
